

ASK AT EVERY VISIT — QUICK REFERENCE TOOL

The purpose of this initiative is to **build confidence** and **reduce barriers** to COVID-19 vaccination.

- **Identify if the individual would like more information about the COVID-19 vaccine and how to get vaccinated.**
- "We know some people have had challenges getting a COVID-19 vaccine. Is this something you need help with?"

- **Help the client to make an informed choice about vaccination and provide information about how to get vaccinated.**
- "Here is some information about how to get your vaccine and what to expect."

Possible ways to support clients:

- Discuss walk-in COVID-19 vaccine clinic locations.
- Provide additional COVID-19 vaccine information.
- Suggest that the individual talk to their family doctor or health care provider if they have questions about specific medical conditions or concerns.
- If feasible, offer to assist with transportation (e.g., bus tickets or taxi vouchers).

COVID-19 Vaccine Safety & Importance

- All of the approved mRNA vaccines have passed quality and safety standards.
- All vaccines provide strong protection against COVID-19 and its variants.
- For those 18+, the best vaccine for your second dose is the vaccine that is available first. The only vaccine currently approved for 12-17-year-olds is the Pfizer BioNTech COVID-19 vaccine.

How to Get the Vaccine

- Everyone turning 12 years of age in 2021 (born in 2009) and older can receive the vaccine
- While Mass Immunization Clinics are closing late August, pop up clinics will continue into September
- The 29 Sperling Drive Barrie COVID-19 Immunization clinic is open until September 29th
- For the most up to date information and clinic locations visit www.smdhu.org/Topics/COVID-19
- Many family doctors and nurse practitioners are offering the vaccine
- The vaccine is also available at most local pharmacies - visit www.covid-19.ontario.ca/vaccine-locations

Where to get more information about COVID-19 Vaccine

Call Health Connection if you need help or have questions **705-721-7520** or **1-877-721-7520**

Call the Provincial booking line **1-888-999-6488** or visit www.ontario.ca/bookvaccine
Offers translation in 300 languages

COVID-19 Vaccine Frequently Asked Questions

How do the COVID-19 mRNA vaccines work?

- Messenger RNA (mRNA) is a genetic blueprint that tells your body how to make a protein found on the surface of the COVID-19 virus, called the spike protein.
- Once vaccinated, your body's immune system makes fighter cells and antibodies against the COVID-19 spike protein. If you come in contact with the COVID-19 virus in the future, your immune system will attack the virus and protect you from getting sick with COVID-19.
- mRNA vaccines **cannot** damage or change our DNA.
- The COVID-19 mRNA vaccines do not contain the live virus and **cannot** cause COVID-19.
- The COVID-19 vaccines are the first time that mRNA knowledge will be used widely in vaccines. mRNA has been studied by researchers for many years.

Were the vaccines rushed?

Creating a new vaccine can sometimes take years. The progress on COVID-19 vaccines happened more quickly for many reasons, including:

- advances in science and technology
- international collaboration among scientists, health professionals, researchers, industry and governments
- increased dedicated funding

No corners were cut while creating the vaccines. One minor change to the usual process was put in place: clinical trials were run at the same time as the vaccines were being made/manufactured; that way, vaccines could be shipped out to different countries as soon as the vaccines were approved by the different countries' health authorities.

What are the expected side effects? What about possible long-term side effects?

Like any medication, vaccines can cause mild side effects and reactions that can last a few hours or a couple of days after vaccination. They are also a positive sign that the vaccine is beginning to work. Common side effects may include:

- redness, soreness or swelling on the arm where you got the needle
- muscle and joint pain
- tiredness
- chills
- headache
- mild fever

Long term side effects: It is more common for vaccines to have side effects that happen right away rather than many months or years later. As part of the vaccine safety program in Canada, ongoing, careful monitoring of the COVID-19 vaccines will continue. There is also longer-term follow-up of those who were vaccinated as part of the clinical trials. Health Canada posts weekly reports on vaccine safety.

Should you get the vaccine if you have had COVID-19?

If you have had COVID-19, you should still get the vaccine. It will help protect you from getting new COVID-19 infections. If you are recovering from COVID-19, you should wait to get the vaccine until you don't have any symptoms and are no longer in self-isolation.
