

Barbicide®

Barbicide is used in salons as a disinfectant for multi-use items. It is a quaternary ammonium compound that should only be used to disinfect non-critical multi-use instruments such as brushes, combs and rollers. Scissors and clippers are classified as semi-critical instruments and require an appropriate disinfectant such as 70-90% alcohol.

The manufacturer of Barbicide® recommends the following:

- ✓ Prepare a fresh solution daily or more often if the solution becomes dirty or diluted.
- ✓ Mix 62.5 ml (1/4 cup) Barbicide® in 1 litre of water for proper dilution.
- ✓ Thoroughly clean brushes, combs, and rollers (with soap and water) prior to complete immersion for 10 minutes.
- ✓ Rinse with water after immersion.
